Homework 1

Amin Yakubu 2/23/2019

```
library(tidyverse)
library(caret)
```

Data

```
train = read_csv('./data/solubility_train.csv')
test = read_csv('./data/solubility_test.csv')
```

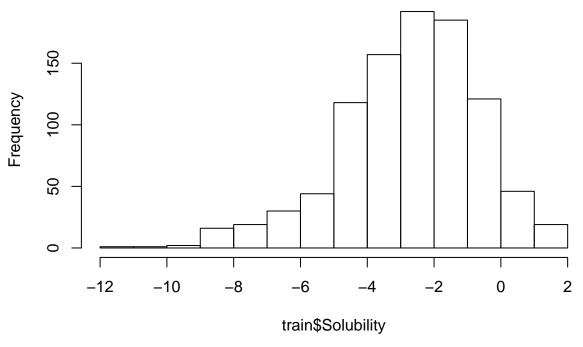

The data has been divided into training and testing. The testing data has 951 observations and the test data has 356 observations. There are 229 predictors. 208 are binary variables that indicate the presence or absence of a particular chemical substructure, 16 are count descriptors, such as the number of bonds or the number of bromine atoms, and 4 are continuous descriptors, such as molecular weight or surface area. The response is in the column Solubility which is a continuous variable

```
# Checking for missing values
missing_train <- sapply(train, function(x) sum(is.na(x)))
print(missing_train[missing_train > 0])

## named integer(0)
missing_test <- sapply(test, function(x) sum(is.na(x)))
print(missing_test[missing_test > 0])

## named integer(0)
No missing data
hist(train$Solubility)
```

Histogram of train\$Solubility

Data processing

```
#Training set
X.train = model.matrix(Solubility ~ ., train)[,-1]
y.train = train$Solubility

#Testing set
X.test = model.matrix(Solubility ~ ., test)[,-1]
y.test = test$Solubility

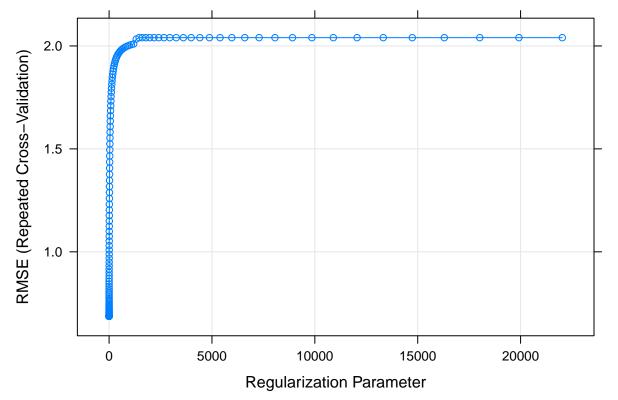

# Validation control
ctrl1 <- trainControl(method = "repeatedcv", number = 10, repeats = 5)</pre>
```

Question 1 – Linear Model

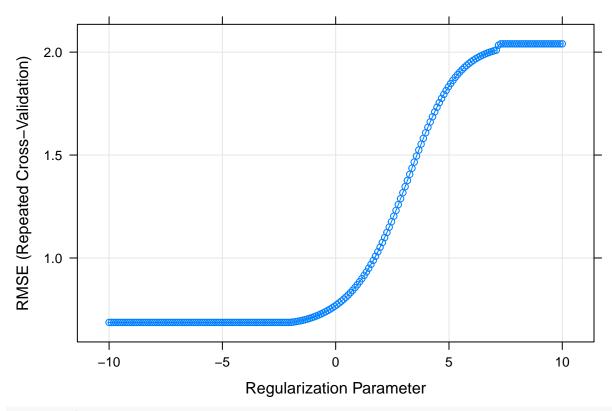

[1] 0.5558898

The test MSE is 0.5558898

${\bf Question} \ {\bf 2-Ridge} \ {\bf Regression}$

plot(ridge.fit, xTrans = function(x) log(x)) # here were are plotting log lambda so it looks like the p

```
ridge.fit$bestTune
```

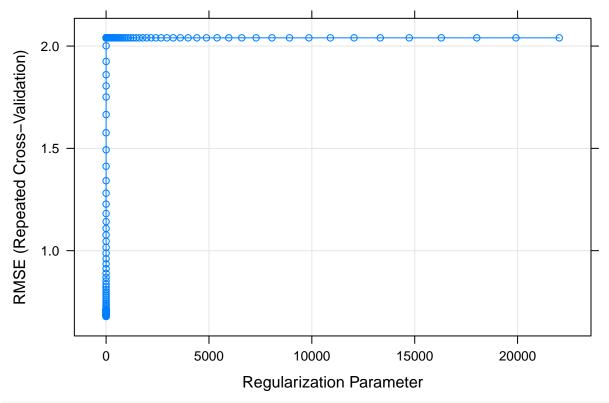

```
## alpha lambda
## 80     0 0.1274155
bestlam.ridge = ridge.fit$bestTune$lambda
bestlam.ridge

## [1] 0.1274155
ridge.pred = predict(ridge.fit$finalModel, s = bestlam.ridge, newx = X.test)
print(mean((ridge.pred - y.test)^2))
```

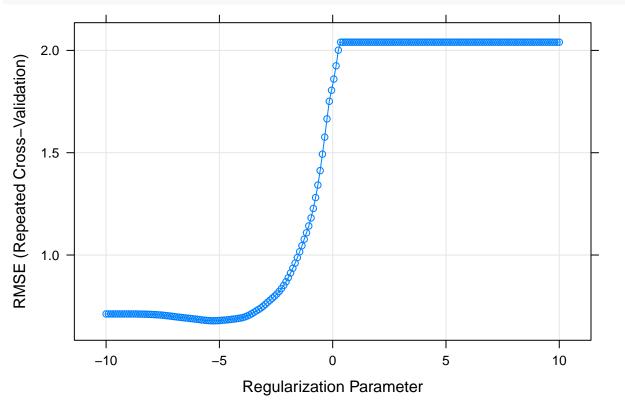

[1] 0.5134603

The mean test error is 0.51346

Question 3 – The Lasso

bestlam.lasso = lasso.fit\$bestTune\$lambda
bestlam.lasso

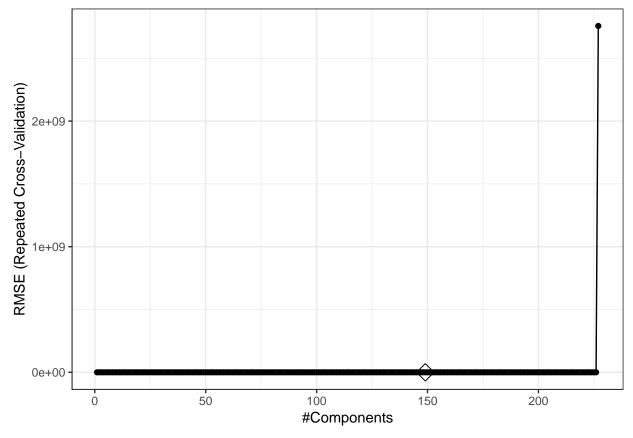

```
## [1] 0.005110889
lasso.pred = predict(lasso.fit$finalModel, s = bestlam.lasso, newx = X.test)
print(mean((lasso.pred - y.test)^2))

## [1] 0.4963234
The mean error is 0.496.
lasso.coef = predict(lasso.fit$finalModel, type = "coefficients", s = bestlam.lasso)[1:ncol(train),]
length(lasso.coef)

## [1] 229
length(lasso.coef[lasso.coef != 0])

## [1] 144
There are 144 non-zero coefficient
```

Question 4 – PCR

The mean test error is 0.54055

Question 5 – Discussion

```
resamp <- resamples(list(lasso = lasso.fit,</pre>
                          ridge = ridge.fit,
                          pcr = pcr.fit,
                          lm = lm.fit))
print(summary(resamp))
##
## Call:
## summary.resamples(object = resamp)
## Models: lasso, ridge, pcr, lm
## Number of resamples: 50
##
## MAE
##

bwplot(resamp, metric = "RMSE")
  lm
 pcr
ridge
lasso
```

RMSE is minimum for the lasso compared to Rigde, PCR and linear method. This means the the coefficient for some of the predictors are truly zero. For this particular dataset, the Lasso provides best fit. Ridge regression is the next best model and the linear model is the worst. This means the shrinking coefficient is helpful. PCR with 149 components results in a model comparable to the linear model.
